Criterion E

Meeting Success Criteria

The success criteria validated by the client (Refer to Appendix B – Approval of Success Criteria).

Success Criteria	Success Criteria Status
1	Achieved: The final file of a specific week indicates the week schedule with scheduled data. Few slots could potentially be empty if no teacher is available which can be handle manually by Admin.
2	Achieved: As there are 32 slots per week, if there are sufficient teacher available for that week then it can be achieved perfectly through algorithm (Refer to Criterion C: Admin: schedule current week)
3	Achieved: User schedule new week page allows User/tutor to specify slots that are not available for them which are forbidden when scheduling
4	Achieved: Like Success Criteria 3, it allows teachers to enter field they are not available in Schedule new week page.
5	Achieved: Admin Current week allows Admin to manually change teacher for each slot. If there are no tutor/User available for a slot, it also allows Admin to manually edit it
6	Achieved: The scheduling algorithm (Refer to Criterion C: Admin: schedule current week) doesn't put bias unpopular slots for any user.
7	Achieved: Simple and nice interface with only buttons to click throughout using the program raise efficiency and raise feedback when error happen for example week not scheduled when User/Admin tried to view a scheduled week that are not yet scheduled.
8	Achieved: All User files will be used for scheduling without bias, and they will be used for scheduling decisions for the system
9	Achieved: It allows Admin to output a final html file after scheduling. This enables manually comparison between human made decision and algorithm.
10	Achieved: Scheduling Algorithm allowed this to happen efficiently and fairly across the week
11	Achieved: User schedule week page allows user to manually enter available slot. In addition, Admin can also edit the schedule according to preferences and enable exchange time slot between teachers

12	Achieved: All User files are named with specific txt file name including their Email/username and date
13	Achieved: Button on Admin mainframe allows Admin to output a html file. It also allows Admin to save it to desktop or local computer to send it to other staff members

Client suggestion for further improvement (Refer to Appendix C – final meeting with client):

1. Improving user and admin interface – (Refer to Appendix C – final meeting with client):
   The current system only displays buttons for user or admin to execute specific tasks. Although useful for efficiency, but a better interface design can improve user satisfaction when using the app.
2. Allow admin to view which user has already scheduled in the system and historical schedules (Refer to Appendix C – final meeting with client):
   The current system does not show the admin member of staff who scheduled already. This can be implemented for improvement to avoid confusion before Admin schedule current week's data.

Recommendations for further improvement:

3. Enable Admin and User to create own profile:
   In the class of User (Refer to Criterion B: UML Diagram for User), it is configurated already such that user can choose their own username, phone number and Icon. But these are not implemented.
4. Artificial intelligence (AI) based systems:
   AI based system for scheduling can be added for further efficiency or handle a change in schedule mode.
